1. Do the following infinite series converge or diverge? Explain.
   (a) $\sum_{n=1}^{\infty} \frac{n^3}{n^{2.9}+1}$ Diverges $a_n \not\to 0$.
   (b) $\sum_{n=1}^{\infty} \frac{n^3}{n^{3.1}+1}$ Diverges since $\frac{n^3}{n^{3.1}+1} \geq \frac{n^3}{2n^{3.1}} = \frac{1}{n^{0.1}}$ (p-series with $p = 0.1$).
   (c) $\sum_{n=1}^{\infty} \left(\frac{n+2}{3n+4}\right)^n$ Converges by the Root Test.
   (d) $\sum_{n=1}^{\infty} (-1)^n(\sqrt{n^2+1} - n)$ Converges by the Alternating Series Test.
   (e) $\sum_{n=1}^{\infty} ((n+1)/n)^{n^2}/n$ Diverges by the Root Test.
   (f) $\sum_{n=1}^{\infty} (\sqrt{n^2+1} - n)$ Diverges since $1/(\sqrt{n^2+1}+n) \geq 1/(\sqrt{4n^2}+n) = 1/3n$.
   (g) $\sum_{n=1}^{\infty} 3^{-\ln n}$ Converges since $3^{-\ln n} = 1/n^{\ln 3}$.
2. Find the interval of convergence of the power series $\sum_{n=1}^{\infty} x^{2n+1}/n(2^n+1)$.
   Converges for $|x| < \sqrt{2}$ by the Ratio Test. Diverges at $x = \pm\sqrt{2}$ since $\frac{2^n\sqrt{2}}{n(2^n+1)} > 1/n$ for $n \geq 2$.
3. Calculate the sum of the geometric series $\sum_{n=2}^{\infty} 3/2^n$. $\frac{3/4}{1-1/2} = \frac{3}{2}$.
4. Write down the Taylor series generated by $\cos x$ at $x = \pi/4$. Simple calculation.
5. Show $\sum_{k=0}^{\infty} (-1)^k(\pi/4)^{2k+1}/(2k+1)! = \sum_{k=0}^{\infty} (-1)^k(\pi/4)^{2k}/(2k)!$.
   Follows from $\sin(\pi/4) = \cos(\pi/4)$ and the Taylor series of $\cos x$ and $\sin x$.
6. Consider a triangle whose sides have length 6 cm, x cm and $(10-x)$ cm. As function of x, for what value of x does the area become largest? Explain.
   Consider an ellipse whose foci are two of the vertices of the triangle.
7. Consider the hyperbola described by the equation $x^2/a^2 - y^2/b^2 = 1$, $a > 0$, $b > 0$. Which of the following statements are true?

   A. The eccentricity e is always greater than 1. True.

   B. If P is a point on the hyperbola, and PF_1 and PF_2 are the distances from P to the two foci F_1 and F_2, respectively, then $|PF_1 - PF_2|$ is independent of the choice of P. True.

   C. The foci are located on the x-axis if $a > b$, and they are located on the y-axis if $a < b$. False.

   D. The graph of the hyperbola is symmetric under both a reflection about the x-axis and a reflection about the y-axis. True.
8. Let $\mathbf{u}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + \mathbf{k}$ and $\mathbf{v}(t) = (2\cos t)\mathbf{i} + (2\sin t)\mathbf{j} + 2\mathbf{k}$. All straightforward.
   (a) Calculate the dot product $\mathbf{u} \cdot \mathbf{v}$.
   (b) The cross product $\mathbf{u} \times \mathbf{v}$.
   (c) Calculate the length of the trajectory whose velocity is equal to $\mathbf{v}(t)$, where the time t varies from $t = 0$ to $t = 2\pi$.
